A country or a person is said to have a 'comparative advantage' if they have the ability to produce something at a lower opportunity cost than their trade partners. In this paper, the determinants of city population and economic growth are estimated, using data from all cities and towns in the country using the Indian town directories from the Census. Then estimates were chosen to exclude any depreciation. The growth regression specifications represented by 2 and 3 are estimated, which represent, respectively, the fixed-effect FE and first-difference FD methods. The main takeaway here Theory and Evidence the country-specific trends, which are positive

and more pronounced than in the charts showing shares of GDP. Such low levels of life expectancy imply high child mortality, lower adult survival rate and high prevalence of disease burden in working age-group which implies a significant loss to human capital which significantly impairs its contribution to economic production.

The following dynamic panel data growth model is estimated via the pooled OLS

there is no evidence of spatial autocorrelation in the residuals, that is, residuals tend to move independently.

Lewer and Van den Berg focus on the size of the relationship between trade and growth to proof whether the statistically-significant relationship is also economically-significant.
